AirZip FileSECURE v4.5 Supported File Formats

FileSECURE supports two formats for securing files:
AZS format is used for file types that can be rendered directly inside the FileSECURE Reader or inside a native application that is protected by FileSECURE.

Please note that FileSECURE can secure ANY file type to AZS format for secure storage, archiving or transfer. However, unless there is a secure renderer available, the file must be unsecured before it can be viewed/used. For example, it is posssible to secure an Access database .mdb file. While secured, it cannot be accessed by unauthorized persons. When it needs to be accessed, an authorized individual must unsecure it and open it in MS Access. The unsecuring action results in an audit record being stored. An administrator can assign or revoke permissions like any other secured file that are effective so long as the file remains secured. Unsecuring can also be restricted to the authorized user's physical workstation.

AZF format can be used for all of the AZS supported formats, plus the output of any application that can print (i.e. anything capable of being converted to PDF can be secured to AZF). AZF offers the advantage of not requiring any other application besides FileSECURE Reader to render.

Directly supported formats (.azs)

File Type	Additional applications needed for secure viewing	Comments
Documents		
doc, docx	MS Word XP, 2003, 2007	
xls, xlsx	MS Excel XP, 2003, 2007	
ppt, pptx	MS PowerPoint XP, 2003, 2007	
txt	Internet Explorer 7 or later	Text files
pdf		Adobe Acrobat
mht	Internet Explorer 7 or later	Web Archives
htm, html	Internet Explorer 7 or later	Web Pages
xml	Internet Explorer 7 or later	
CAD formats
